

# APIs become interfaces.

Paste a GET endpoint or a curl command. Imago reads the JSON, works out its shape, and builds the page the data deserves, with metrics, charts and tables drawn by its own components.

response → shape → plan → interface

Live example: Open-Meteo forecast

## Reads the shape

Values become types, types become a plan. A forecast gets metrics and a chart; a book search gets a table.

## Watches endpoints change

Every fetch is diffed against the last one. Amber marks exactly what moved, down to the field.

## Remembers every interpretation

Each response shape is hashed. Seen it before? The stored interface comes straight back, with no model call.

## Safe by construction

The model returns a small JSON plan, never HTML. Every value is written as text, and your keys stay in your browser.

Paste your first endpoint.

Works without a key · No backend · No sign-up

Paste an API URL or a curl command
